

Problem Statement :

India's LPG distribution system faces several challenges:

- Sudden cylinder shortages due to panic booking.
- Lack of awareness among consumers regarding cylinder depletion.
- Inefficient inventory planning for LPG agencies.
- Difficulty in predicting area-wise cylinder demand.

Need :

An intelligent system capable of predicting LPG consumption and enabling proactive supply management.

Objectives :

- Predict the remaining life of LPG cylinders using Machine Learning.
- Recommend optimal refill dates to consumers.
- Enable automatic refill booking when gas levels reach a threshold.
- Forecast area-wise cylinder demand for efficient distribution planning.
- Reduce panic booking and improve supply chain efficiency.
